The optically active compound DL-flavanone was detected using a dedicated circular dichroism detector (CD-1595). Fig. 1 shows optically resolved CD spectrum of 1mg DL-flavanone analyzed using the CD-1595 with stopped flow and the full wavelength range chromatograms. The CD spectrum makes it easy to select the required wavelength.

Fig. 2 shows the CD-1595, OR-990 optical rotation detector and MD-910 diode array detector chromatograms of 0.1mg DL-flavanone. The CD-1595 can detect the D or L forms with good sensitivity.
