

# HPLC, LC/MS Columns

## *InertSustain AQ-C18*

# Physical Properties

## *InertSustain® AQ-C18*

---

✓ Silica	: ES Silica Gel	✓ Carbon Load	: 13.0 %
✓ Particle Size	: 1,9 µm, 3 µm, 5 µm	✓ End-capping	: Complete
✓ Surface Area	: 350 m <sup>2</sup> /g	✓ pH Range	: 1 – 10
✓ Pore Size	: 100 Å (10 nm)	✓ USP Code	: L1
✓ Pore Volume	: 0.85 mL/g		
✓ Bonded Phase	: Octadecyl Groups		
✓ Bonded-Phase Structure	: * Monomeric		

*\* Although it is classified as a monomeric type ODS, the bonding of ODS groups are optimized to retain highly polar compounds.*

# Benefits of InertSustain AQ-C18

- Exceptional polar compound retention in reversed phase mode
- The usage of highly inert packing with superior column lifetime

- ✓ True polar compound retention without using any secondary interaction
- ✓ Improve separation between polar analytes and solvent peaks or sample matrices
- ✓ Enhanced retention can also prevent ion suppression in LC/MS methods

# **Method Development for Polar Compounds**

## **First Choice Column** **Conventional ODS Column**

**In case there were no retention of polar compounds...**

- 1. Use of ion-pairing reagents**
- 2. Use of 100% water mobile phase**

**Often experience shorter column lifetime, poor method reproducibility,  
increased instrument maintenance...**

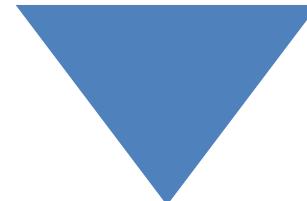

**What other options are left?**

# **Method Development for Polar Compounds**

## **Second Choice Columns**

### **3. Use of different reversed phase columns**

- Selecting different ODS columns having different carbon loading %
- Selecting polar embedded ODS columns
- Selecting different stationary phase columns such as Phenyl or PFP columns

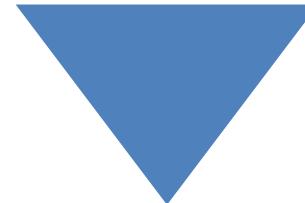

- Really hard to tell if the polar analytes will be retained or not.
- Adsorbed peaks of target analytes occur due to secondary interaction.

## Second Choice Columns

### 4. Use of different interactions

- Selecting mix mode columns (ion-exchange + ODS)
- Selecting HILIC columns (hydrophilic interaction)

- Use of high concentration buffer (harsh mobile phase).
- Reproducibility issues.
- Takes time to equilibrate columns prior to the analysis.

# Method Development for Polar Compounds

## **How will InertSustain AQ-C18 columns help with your polar samples?**

- Easier to develop and optimize analytical conditions
- Offer strong polar compound retention even under 100% water or water rich mobile phases

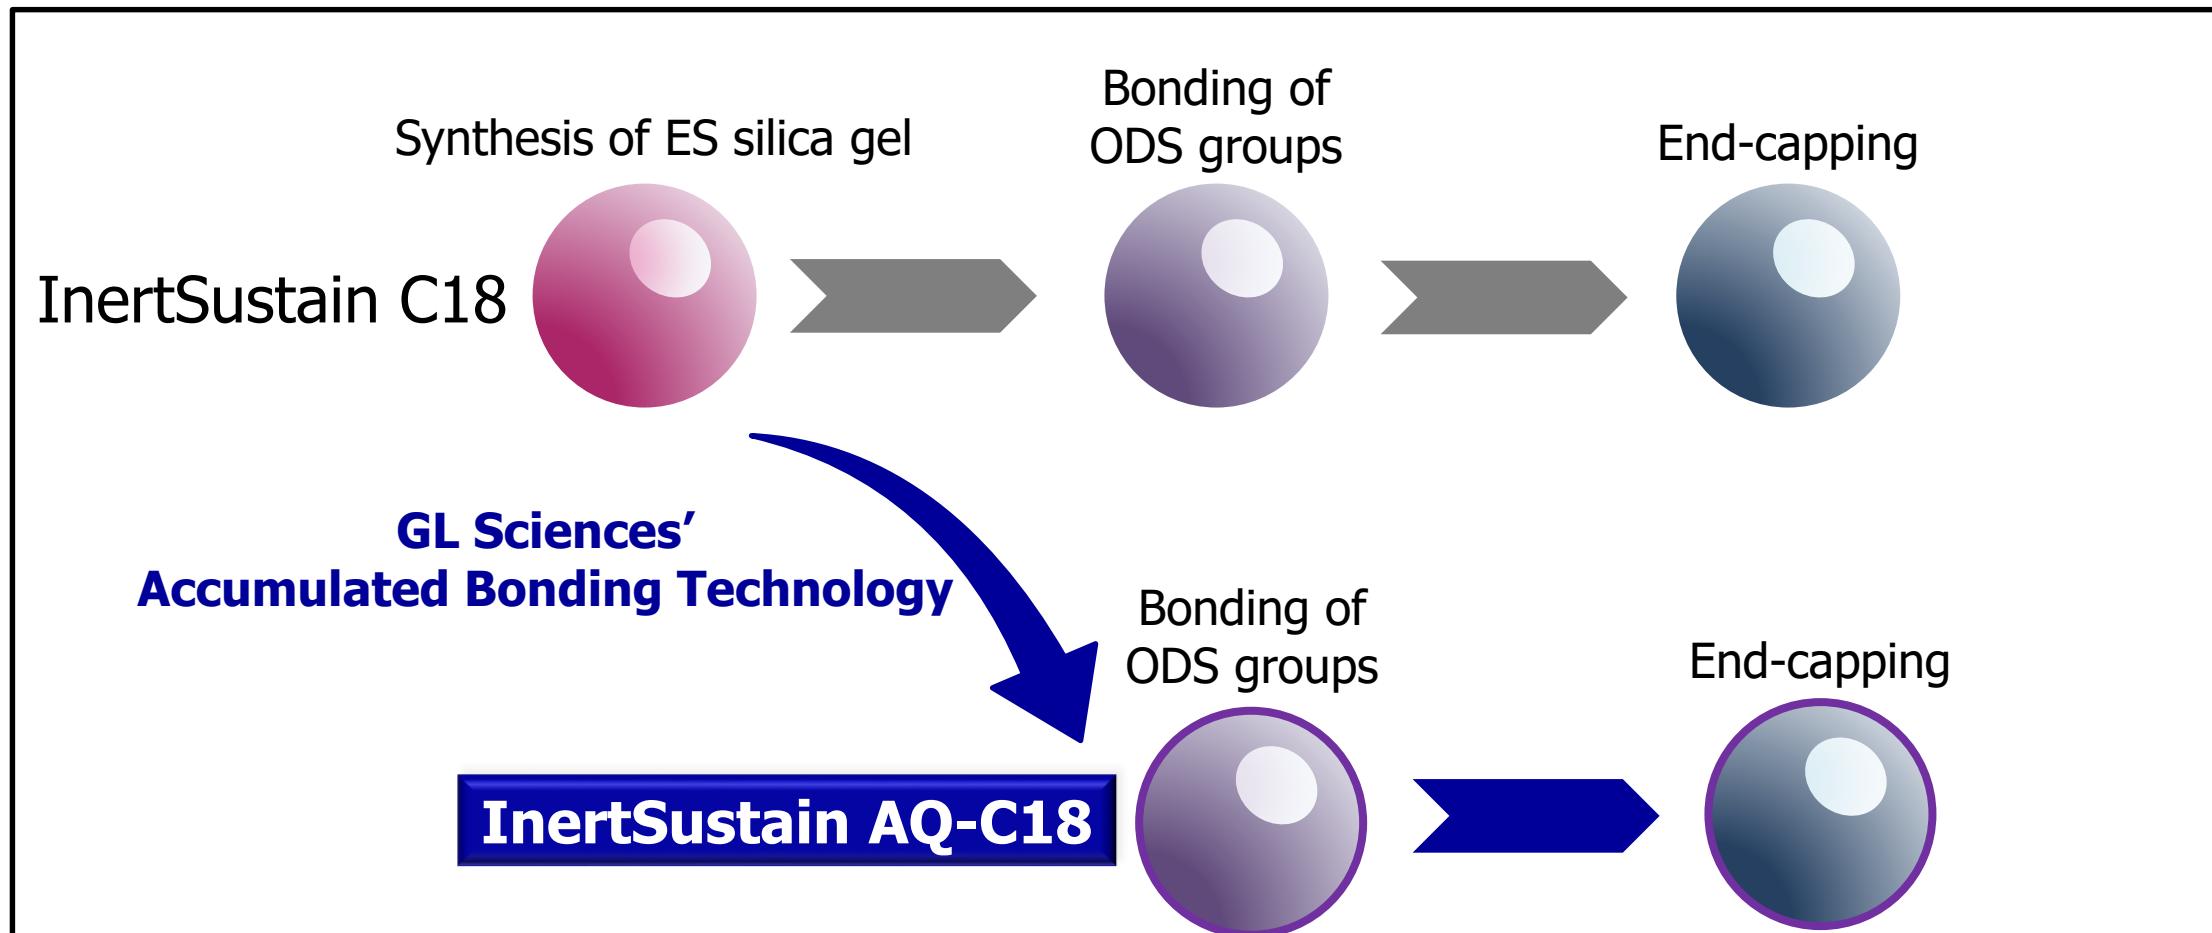

# **Method Development for Polar Compounds**

## **How will InertSustain AQ-C18 columns help with your polar samples?**

- The usage of highly inert packing results in delivering symmetric peaks for virtually any type of compounds
- Eliminating the use of ion-pairing reagents improves method reproducibility, extends column lifetime and reduces instrument maintenance

# GL Sciences' Accumulated Bonding Technology

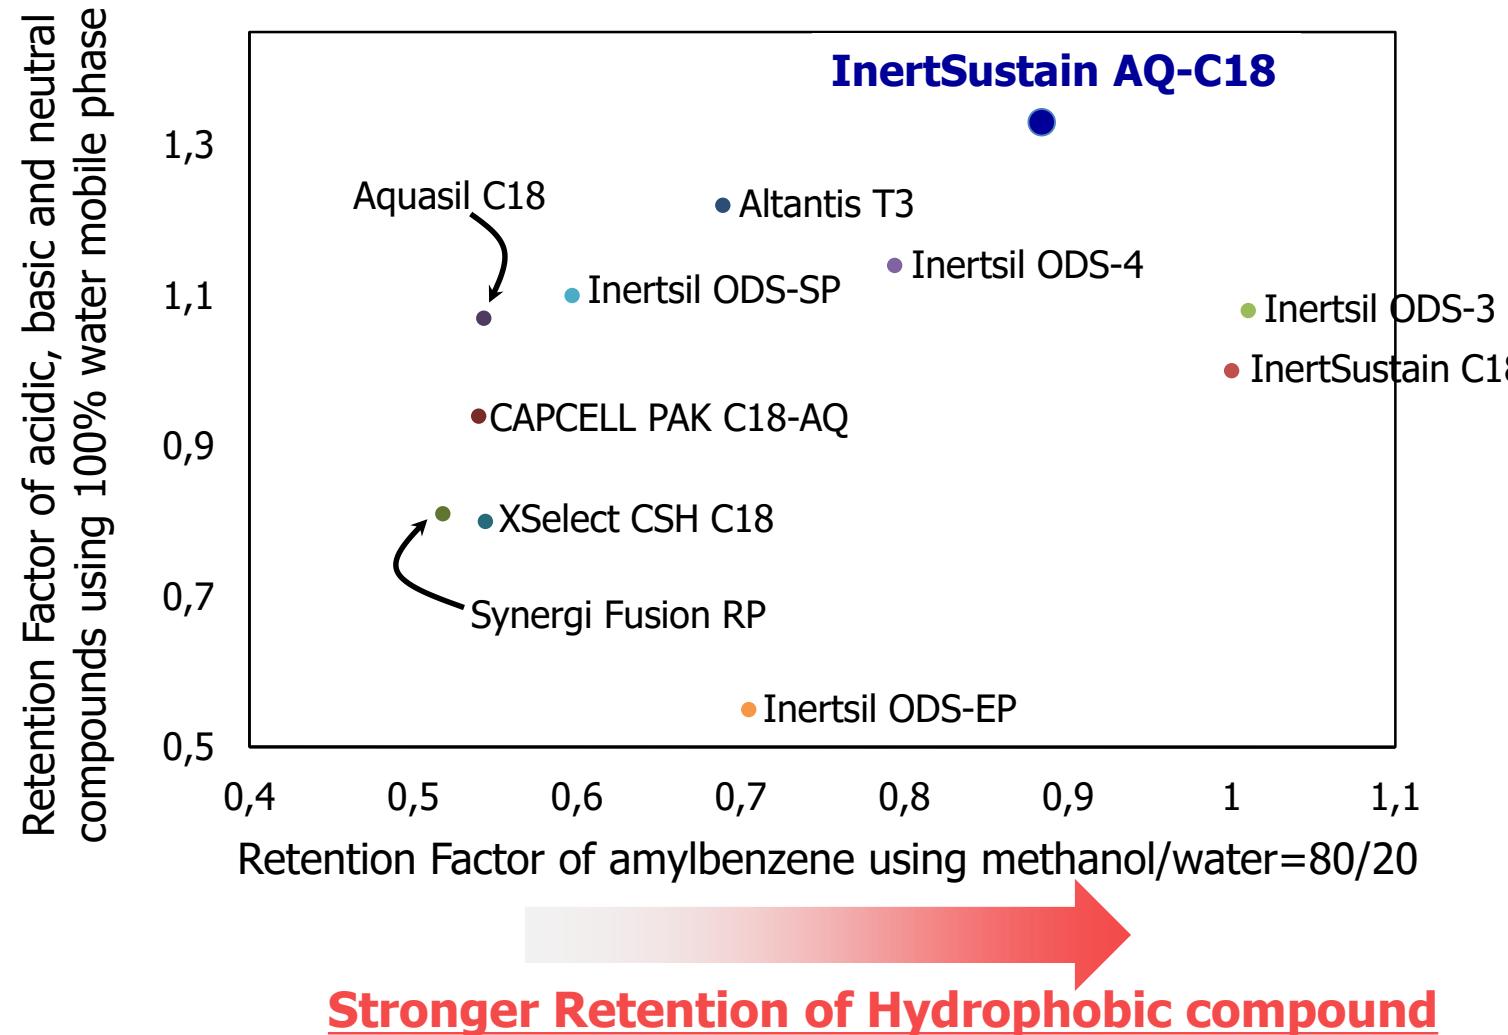

GL Sciences' accumulated bonding technology and know-how allows InertSustain AQ-C18 to provide exceptional polar compound retention. Specifically, optimization of bonding of the C18 groups at equal distance to the silica gel enable InertSustain AQ-C18 to offer significant retention for highly polar compounds even under water rich mobile phases.

# Retention Properties of InertSustain AQ-C18

## Comparison of Retentivity for Hydrophilic compounds between various ODS columns

Stronger Retention of Hydrophilic compounds

Remarks:

1. The horizontal and vertical retention factor values were calculated with reference to the retention factor values obtained from InertSustain C18.
2. The horizontal values represents the retention factor of amylbenzene using methanol/water=80/20.
3. The vertical values represents the retention factor of acidic, basic and neutral compounds using 100% water mobile phase. (For further details, please see the next 2 slides)

# Determination of Retentivity for Hydrophilic Compounds

Two different mobile phases were used in this testing, 0.1 % formic acid in H<sub>2</sub>O and 0.1 % phosphoric acid in H<sub>2</sub>O. And total of 6 compounds were used to determine the retention factor of these 6 compounds to confirm the retentivity of each column.

## Testing Conditions 1.

Column : 5 µm, 150 × 4.6 mm I.D.  
Eluent : 0.1 % formic acid in H<sub>2</sub>O

Sample:

- 1. Pyridoxamine**      **(Basic)**
- 2. Dopamine**      **(Basic)**
- 3. Acetic Acid**      **(Acidic)**
- 4. Succinic Acid**      **(Acidic)**
- 5. Uracil**      **(Neutral)**
- 6. 5-methyluridine**      **(Neutral)**

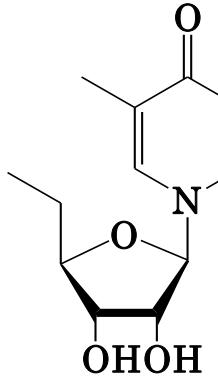

## Testing Conditions 2.

Column : 5 µm, 150 × 4.6 mm I.D.  
Eluent : 0.1 % phosphoric acid in H<sub>2</sub>O

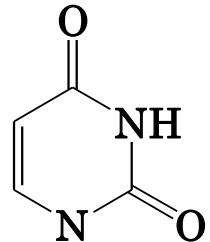

Sample:

- 1. Pyridoxamine**      **(Basic)**
- 2. Dopamine**      **(Basic)**
- 3. Acetic Acid**      **(Acidic)**
- 4. Succinic Acid**      **(Acidic)**
- 5. Uracil**      **(Neutral)**
- 6. 5-methyluridine**      **(Neutral)**

When the surface of the silica gel is basic:

When the surface of the silica gel is acidic:

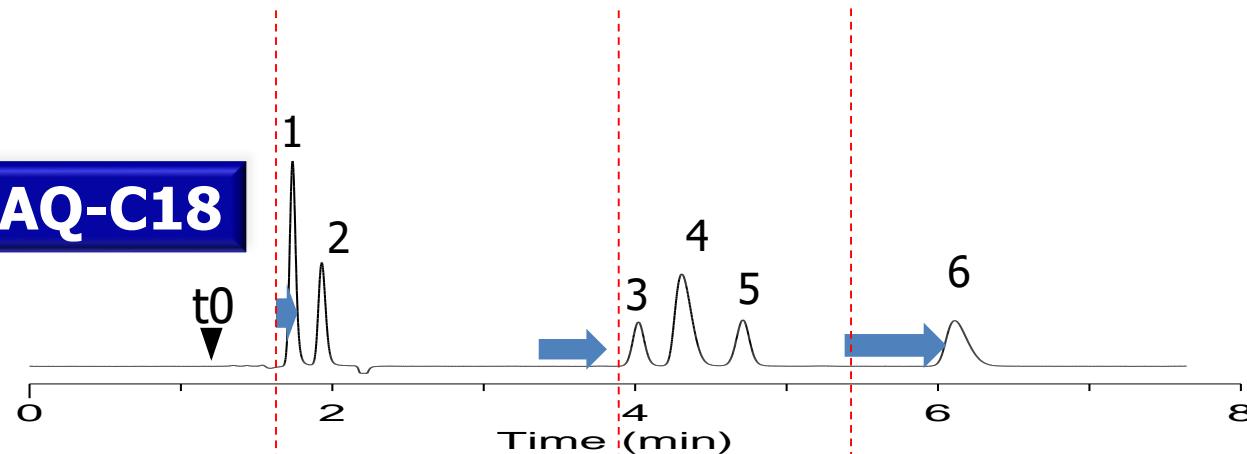

Retentivity = **Acidic** >> **Basic** (Neutral compounds are not influenced)

Retentivity = **Basic** >> **Acidic** (Neutral compounds are not influenced)

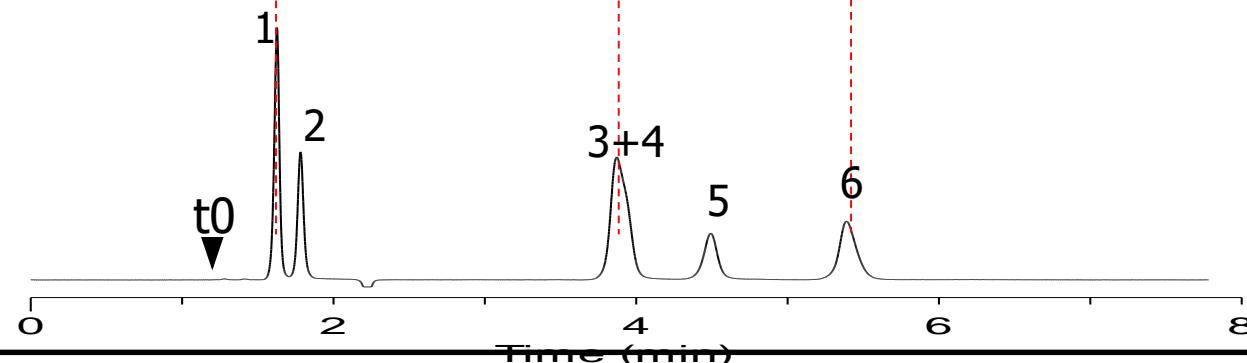

# Comparison of Retention for Water-Soluble Vitamin B

The use of ion-pairing reagents is a popular approach to retain water-soluble vitamins. Instead, 0.1% HCOOH in H<sub>2</sub>O was used to demonstrate and compare the retention for water-soluble vitamins. As proven below, InertSustain AQ-C18 delivered significant retention without the need for such reagents.

**InertSustain AQ-C18**

| 5. Nicotinamide   | (B3) |
| 6. Pyridoxine     | (B6) |

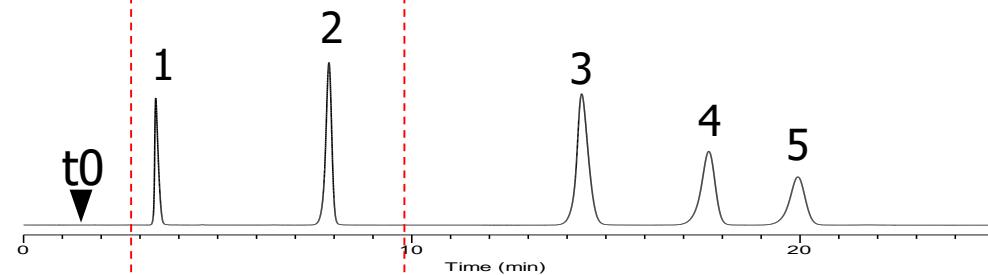

# Comparison of Retention for Nucleosides

Nucleosides are often analyzed in HILIC mode as they are highly hydrophilic . However, ODS columns also show some retention under 100% water mobile phase. In the following test, InertSustain AQ-C18 demonstrated to show simply stronger retention without the change of selectivity and analytical condition.

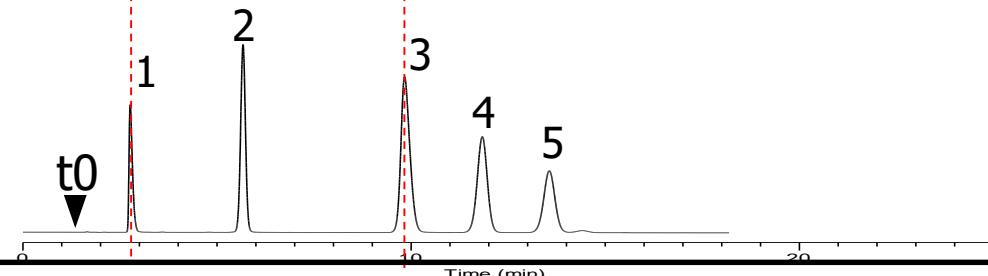

## InertSustain AQ-C18

## Atlantis T3

## InertSustain C18 (Conventional ODS)

### Conditions

Column : 5  $\mu$ m, 150  $\times$  4.6 mm I.D.  
Eluent : 0.1% HCOOH in H<sub>2</sub>O  
Flow Rate : 1.0 mL / min  
Col. Temp. : 40 °C  
Detection : UV 254 nm

Sample    1. Cytidine  
            2. Uridine  
            3. Adenosine  
            4. Guanosine  
            5. 5-Methyl uridine

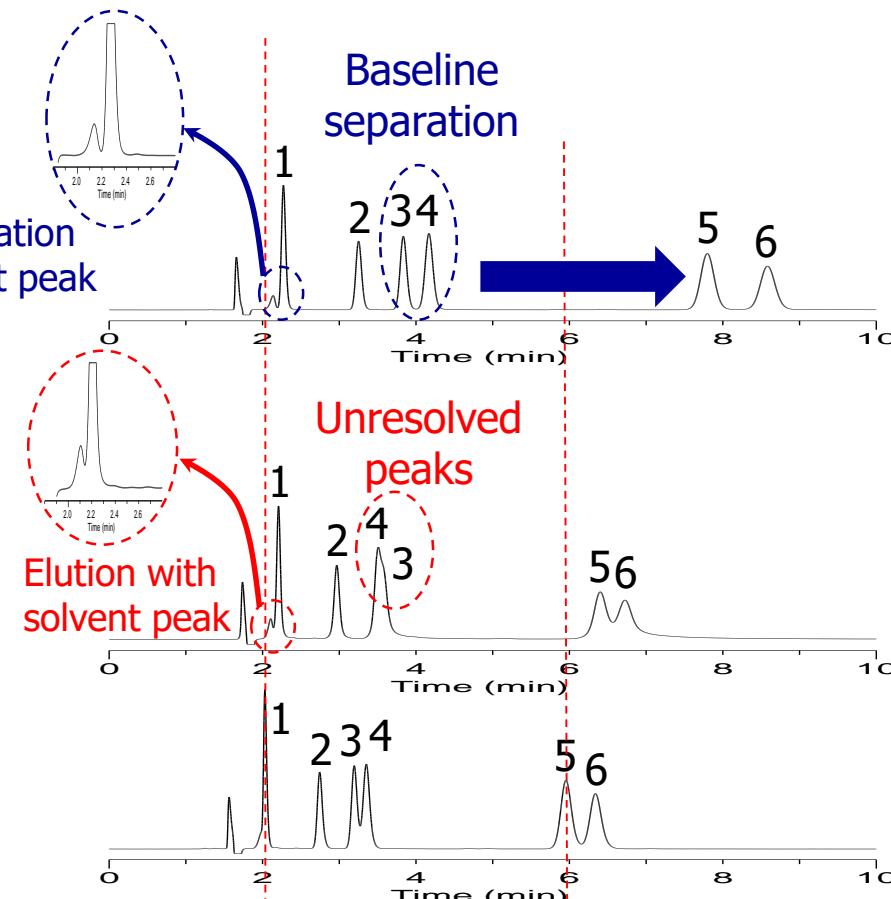

# Comparison of Retention for Catechins (Neutral)

As shown below, InertSustain AQ-C18 delivered stronger retention of catechins even under 20% organic solvent mobile phase with exceptional peak shapes, while competitive column brand failed.

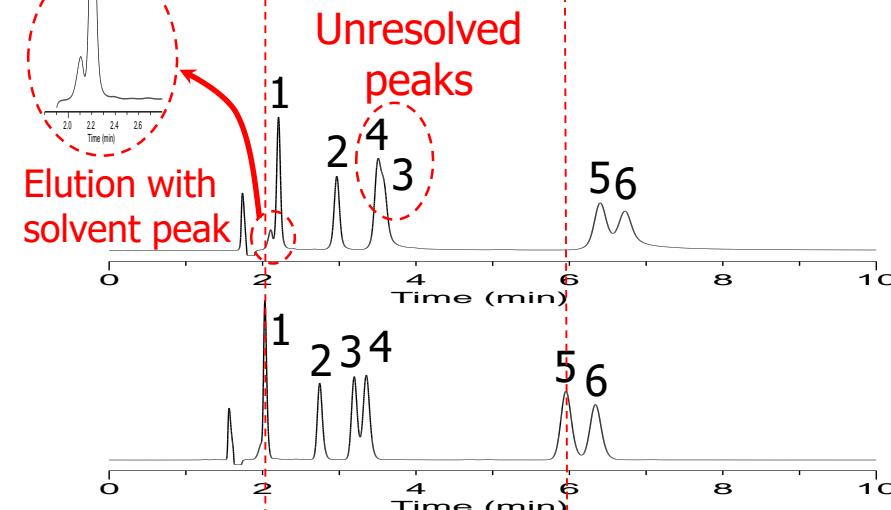

Furthermore, InertSustain AQ-C18 can prevent the co-elution between the targeted polar analytes and solvent peaks or sample matrices due to its enhanced retentivity.

## InertSustain C18

(Convetnional ODS)

# Exceptional Peak Shapes + Retention for Polar Compounds

The structure of highly polar compounds contains ionic groups or metal complexes and they tend to be adsorbed to the packing material which results in tailing of peaks. In addition, polar embedded C18 columns or C18 columns with hydrophilic end-capping are available in the market for retaining highly polar compounds. However, they often show tailing or poor peak shapes due to the secondary interaction from their embedded functional groups.

InertSustain AQ-C18 not only provide strong retention for highly polar compounds, but also delivery symmetric peak shapes for virtually any type of analytes.

## InertSustain AQ-C18 Offer Both Superior Benefits

Retention for Polar  
Compounds

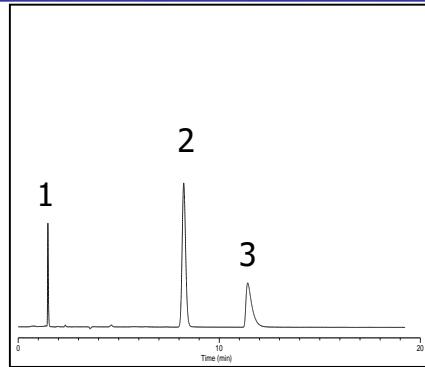

Highly Inert Packing  
Material

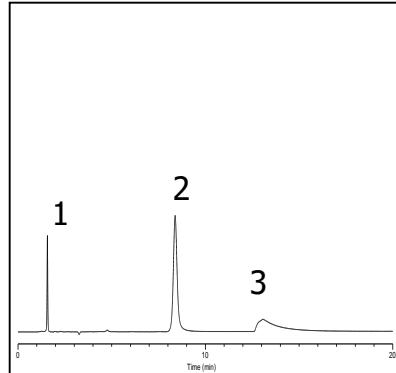

# Comparison of Peak Shapes for Basic Compounds

Dextromethorphan is a strong basic compound. Severe tailing can be confirmed when the packing material contains residual silanol groups.

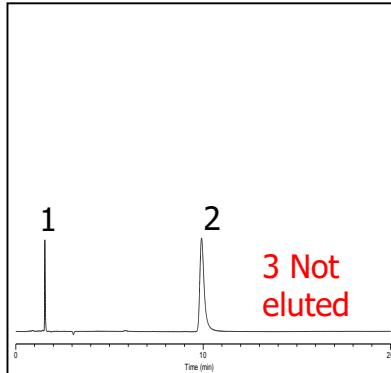

**InertSustain AQ-C18**

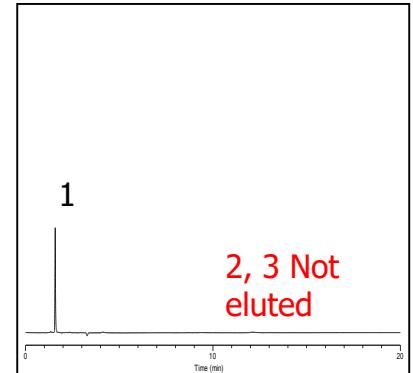

**Atlantis T3**

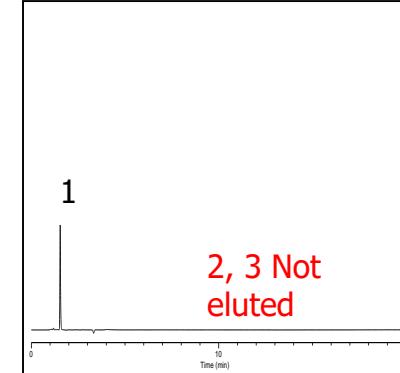

**CAPCELL PAK C18-AQ**

**Syngi Fusion RP**

**Aquasil C18**

## Conditions

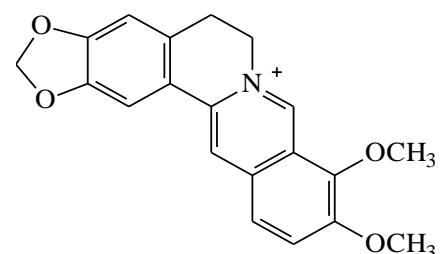

Eluent : A)  $\text{CH}_3\text{CN}$  B) 25 mM  $\text{K}_2\text{HPO}_4$  (pH 7.0)  
A/B = 30/70, v/v

A/B = 25/75, v/v

Flow Rate : 1 mL/min

Col. Temp. : 40 °C

Detection : UV 254 nm

Sample : **1. Brilliant Blue FCF**  
2. Phenol  
3. Salicylic acid

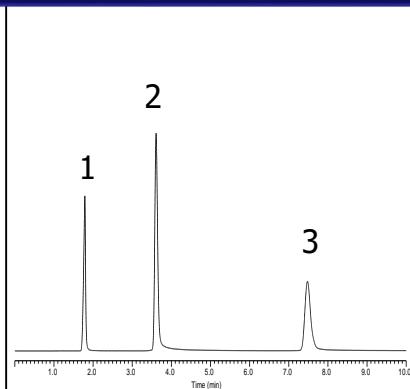

**1. Brilliant Blue FCF**

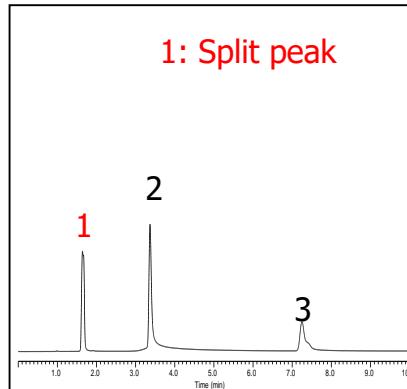

# Comparison of Peak Shapes for Chelating Compounds

Hinokitiol and Piroctone Olamine are strong chelating compounds, which coordinately binds with the surface of residual trace metal impurities, resulting in severe tailing. However, the peak shape improves as the injection increases since the surface of the packing material of the adsorption active sites eventually become masked.

**3. Piroctone Olamine**

# Comparison of Compatibility with 100% Water Mobile Phase

When analyzing hydrophilic compounds under water rich mobile phase condition, once the pump is stopped, the hydrophobic bonded group pushes the aqueous mobile phase out off the pore in an irreversible fashion, in what has become known as the dewetting phenomenon. InertSustain AQ-C18 guarantees compatibility with 100% aqueous mobile phases without the risk of dewetting.

## Testing Procedure:

- 1) 100 % water is introduced into column over 60 minutes.
- 2) Conduct Analysis (1<sup>st</sup> injection).
- 3) Stop flow for 15 minutes.
- 4) 100 % water is introduced again into column over 30 minutes.
- 5) Conduct Analysis (2<sup>nd</sup> injection).
- 6) Stop flow for 15 minutes again.
- 7) 100 % water is introduced again into column over 30 minutes.
- 8) Conduct Analysis (3<sup>rd</sup> injection).
- 9) Disconnect the column from the system and stored for 24 hrs.
- 10) 100 % water is introduced into column over 30 minutes.
- 11) Conduct Analysis (4<sup>th</sup> injection).

## Conditions

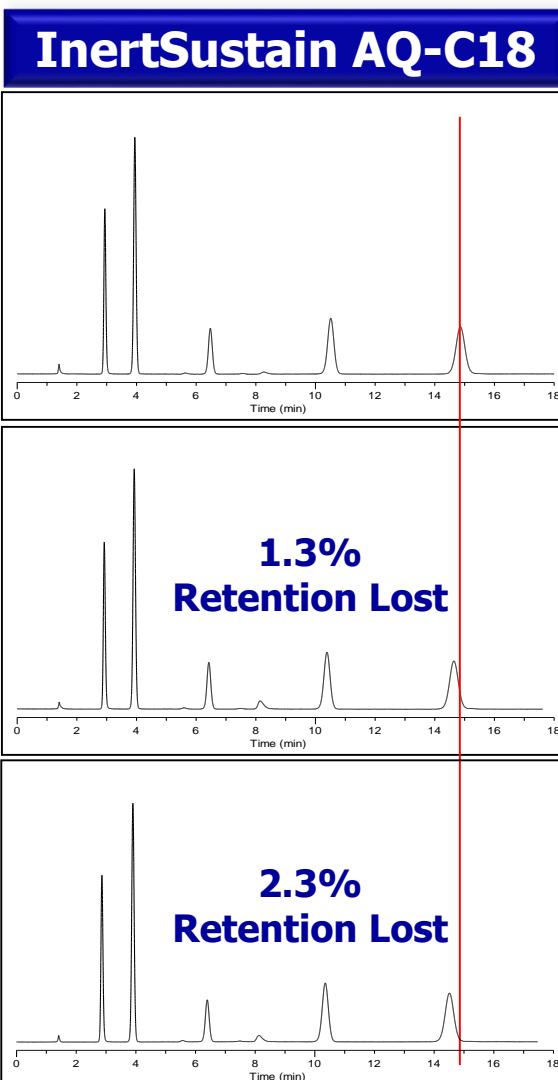

Eluent : H<sub>2</sub>O (100%)  
Flow Rate : 1 mL/min  
Col. Temp. : 40 °C  
Detection : UV 254 nm

## Sample :

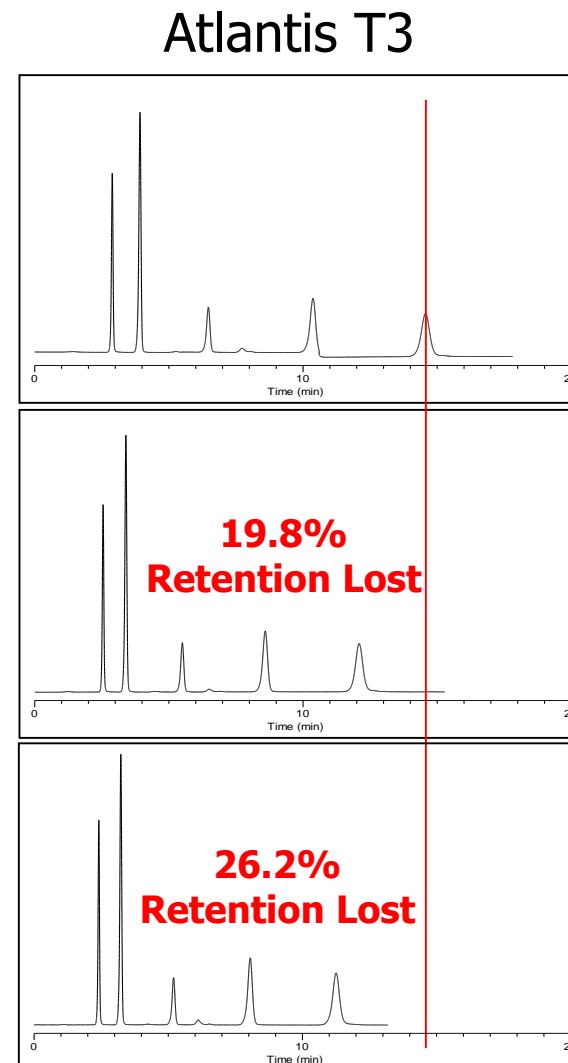

1. Cytosine
2. Uracil
3. Guanine
4. Thymine
5. Adenine

# Extended Column Lifetime at Low pH

## Durability Test at Low pH (pH 1.0)

### Purging Conditions:

Column : 5 µm, 150 × 4.6 mm I.D.  
Eluent : CH<sub>3</sub>CN/ H<sub>2</sub>O/ TFA (10/90/1), v/v/v (pH 1)  
Column Temp. : 60 °C

### Analytical Conditions:

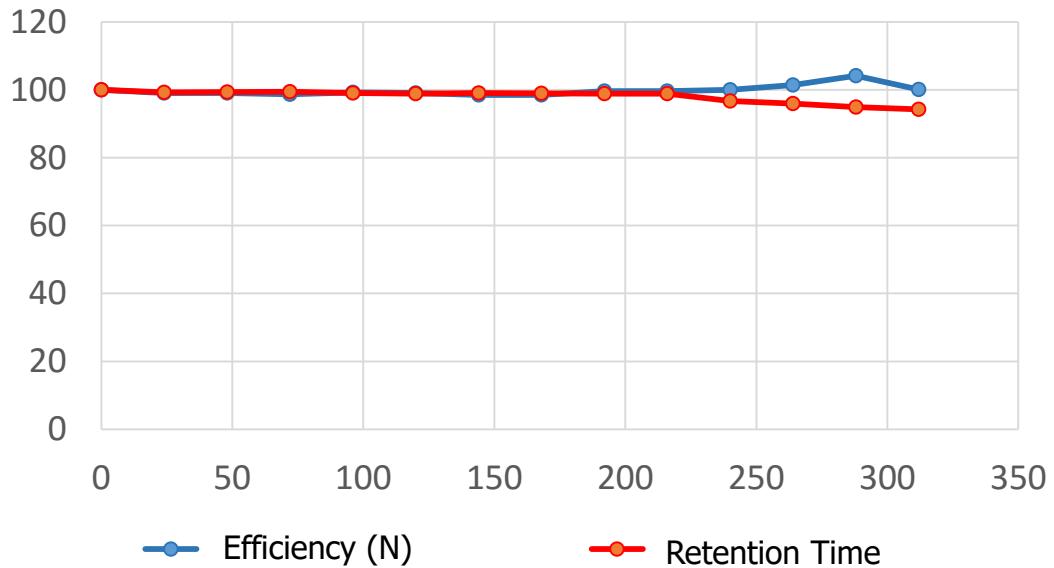

Eluent : CH<sub>3</sub>CN/H<sub>2</sub>O = (65/35), v/v  
Flow Rate : 1.0 mL / min  
Col. Temp. : 40 °C  
Detection : UV 254 nm  
Sample : Naphthalene

### Results:

Retention Time : Only 10.7% Retention Lost  
Efficiency (N) : Only 0.2% Efficiency Lost

# Extended Column Lifetime at High pH

## Durability Test at High pH (pH 9.5)

### Purging Conditions:

Column : 5 µm, 150 × 4.6 mm I.D.  
Eluent : 50 mM TEA (pH 9.5)/CH<sub>3</sub>OH = 70/30, v/v  
Flow Rate : 1.0 mL/min  
Column Temp. : 50 °C

### Analytical Conditions:

Eluent : CH<sub>3</sub>CN/H<sub>2</sub>O = (65/35), v/v  
Flow Rate : 1.0 mL / min  
Col. Temp. : 40 °C  
Detection : UV 254 nm  
Sample : Naphthalene

### Results:

Retention Time : Only 5.8% Retention Lost  
Efficiency (N) : Only 0.6% Efficiency Lost

# Summary

## First Choice Column Conventional ODS Column

In case there were no retention of polar compounds...

## Second Choice Column InertSustain AQ-C18

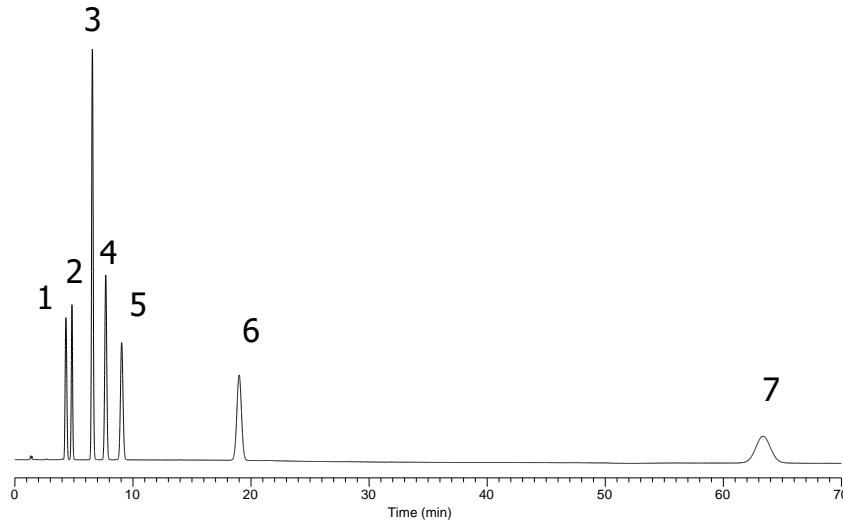

- \*Easier to develop and optimize analytical conditions
- \*Offer strong polar compound retention even under 100% water or water rich mobile phases
- \*The usage of highly inert packing results in delivering symmetric peaks for virtually any type of compounds
- \*Eliminating the use of ion-pairing reagents improves method reproducibility, extends column lifetime and reduces instrument maintenance

## Analysis of Water-Soluble Pesticides

Polar compounds coordinates to trace metal impurities in the packing resulting in providing poor peak shapes and low sensitivity. The same phenomenon is observed on water-soluble pesticides, however, InertSustain AQ-C18 delivers high sensitivity with exceptional peak shape, while other brand show adsorption of peak and lower sensitivity.

Difference in Sensitivity

# Retention Mechanism of InertSustain AQ-C18

InertSustain AQ-C18 columns are designed to achieve strong retention for highly polar compounds, which is the most challenging goals in developing reversed phase methods. The optimization of bonding of the C18 groups at equal distance to the silica gel enable InertSustain AQ-C18 to offer significant retention for highly polar compounds even under water rich mobile phases.

Retention for Polar Analytes under Water Rich Mobile Phases	★★★	★★★	★★★★★	★★★

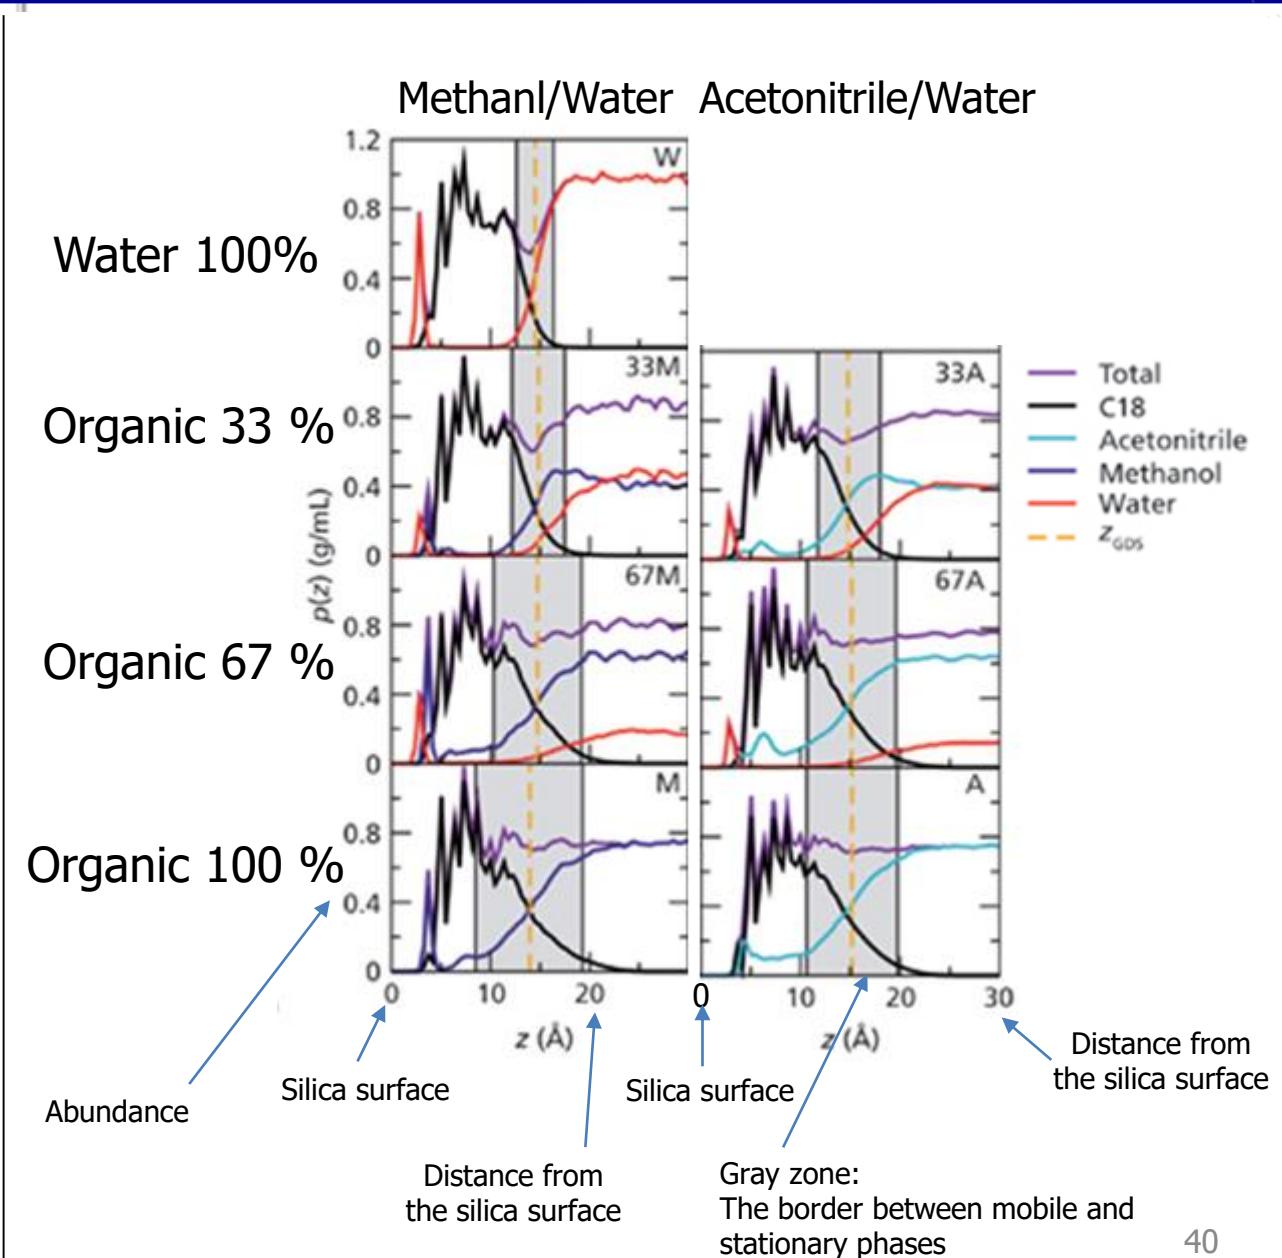

# Cited Literature

Schure, Mark R., Jake L. Rafferty, Ling Zhang, and J. Ilja Siepmann. 2013. How reversed-phase liquid chromatography works. *LCGC North America* 31 (8) (JAN 01): 630-7.

<http://www.chromatographyonline.com/how-reversed-phase-liquid-chromatography-works-0>

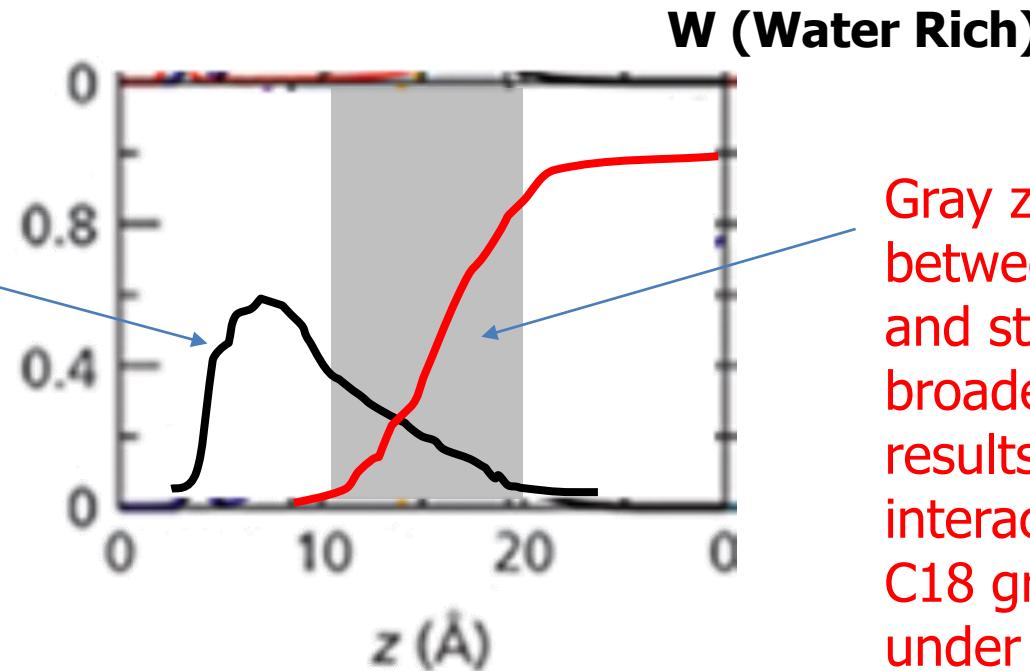

Density profiles of C18 chains, methanol, water, and acetonitrile for pure water (W), pure methanol (M), pure acetonitrile (A), and solvent mixtures given as mole percent.

It appears that very little solvent is present in the interior of the chain system for highly aqueous mobile phases and there are simply no solvent molecules to displace the solute. The solute, therefore, has little to no competition with the solvent for interaction sites within the chain interior region, resulting in less retention of analytes.

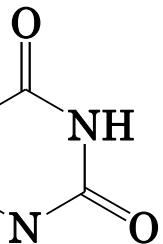

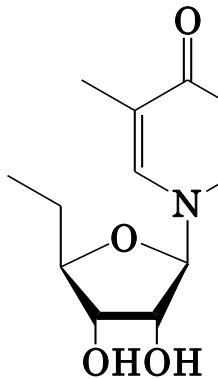

## Estimated Model of InertSustain AQ-C18 created by GL Sciences

The black C18 line is flattened, which indicates the C18 groups are straightened out instead of being tangled up at the surface of silica.

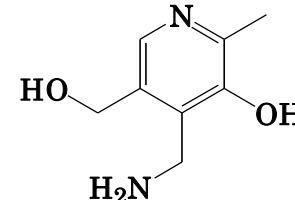

Gray zone, the border between mobile phase and stationary phase are broader/wider, which results in having more interaction between the C18 groups and analytes under water rich mobile phases.

## Hydrophobic Property of Column

Sample No.6, n-Amylbenzene was used to determine the hydrophobic property of columns.

## Conditions

Column : 5 µm, 150 × 4.6 mm I.D.  
 Eluent : CH<sub>3</sub>OH/H<sub>2</sub>O = 80/20, v/v  
 Flow Rate : 1.0 mL/min  
 Col. Temp. : 40 °C  
 Detection : UV 254 nm  
 Injection Vol : 2.5 µL  
 Sample : 1. Uracil 2. Toluene 3. Ethylbenzene 4. Propylbenzene  
       5. n-Butylbenzene 6. n-Amylbenzene

## Basic Compound Test (1)

A basic compound test using antihistamine drugs and are highly basic, which can show tailing of peaks and different elution pattern on columns with insufficient end-capping. Column with insufficient end-capping will show later elution of sample 1, 2, 3 and 5.

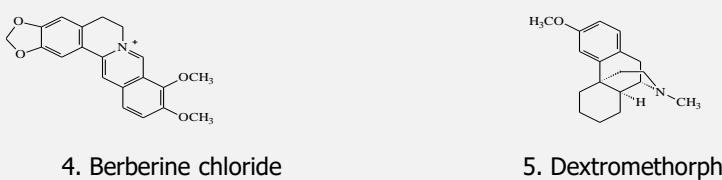

## Conditions

Column : 5 µm, 150 × 4.6 mm I.D.  
 Eluent : A) CH<sub>3</sub>CN  
           B) 25mM K<sub>2</sub>HPO<sub>4</sub> (pH 7.0, KH<sub>2</sub>PO<sub>4</sub>)  
           A/B = 60/40, v/v  
 Flow Rate : 1.0 mL/min  
 Col. Temp. : 40 °C  
 Detection : UV 220 nm  
 Injection Vol : 1µL  
 Sample : 1. Chlorpheniramine    2. Triprolidine  
           3. Homochlorcyclizine    4. Hydroxyzine  
           5. Clemastine

## Basic Compound Test (2)

Dextromethorphan is a strong basic compound. Severe tailing can be confirmed when the packing material contains residual silanol groups.

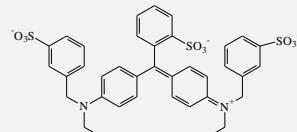

## Conditions

Eluent	: A) CH <sub>3</sub> CN B) 25 mM K <sub>2</sub> HPO <sub>4</sub> (pH 7.0, KH <sub>2</sub> PO <sub>4</sub> ) A/B = 30/70, v/v
Flow Rate	: 1mL/min
Col. Temp.	: 40 °C
Detection	: UV 230 nm
Injection Vol	: 2.5 µL
Sample	: 1:Uracil    2:Berberine chloride    3:Dextromethorphan

# Comparison of Performance

## Acidic Compound Test

Sharp peaks can be obtained when analyzing Phenol or Salicylic Acid. However, as Brilliant Blue FCF has three sulfonic groups in its chemical structure, tailing will occur when the surface of the packing material is slightly basic.

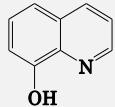

1. Brilliant Blue FCF

### Conditions

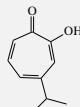

Column	: 5 $\mu$ m, 150 $\times$ 4.6 mm I.D.
Eluent	: A) CH <sub>3</sub> CN    B) 0.1% H <sub>3</sub> PO <sub>4</sub> A/B = 25/75,v/v
Flow Rate	: 1 mL/min
Col. Temp.	: 40 °C
Detection	: UV 254 nm
Injection Vol	: 2 $\mu$ L
Sample	: 1.Brilliant Blue FCF    2. Phenol    3.Salicylic acid

## Chelating Compound Test

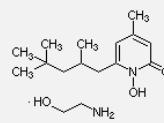

Traditional chelating compound test used phosphate buffer, which made it easy to elute these type of chelating compounds. In this test, formic acid mobile phase is used as it is regularly used in LC/MS methods and hard to detect in such condition. Piroctone Olamine is used in this test, which is now widely used as antimicrobial agents.

1. 8-Quinolinol

2. Hinokitiol

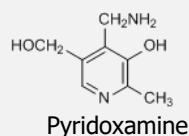

3. Piroctone Olamine

### Conditions

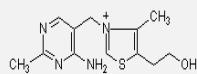

Column	: 5 $\mu$ m, 150 $\times$ 4.6 mm I.D.
Eluent	: A) CH <sub>3</sub> CN    B) 0.1 %HCOOH A/B = 40/60,v/v
Flow Rate	: 1 mL/min
Col. Temp.	: 40 °C
Detection	: UV 310 nm
Injection Vol	: 2 $\mu$ L
Sample	: 1. 8-Quinolinol 2. Hinokitiol 3. Piroctone Olamine

## Polar Compound Test (Water-Soluble Vitamins)

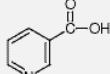

The use of ion-pairing reagents is a popular approach to retain water-soluble vitamins. Instead, 0.1% HCOOH in H<sub>2</sub>O was used to demonstrate and compare the retention for water-soluble vitamins.

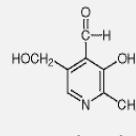

Pyridoxamine

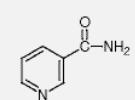

Thiamin

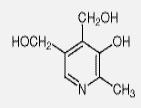

Nicotinic Acid

Pyridoxal

Nicotinamide

Pyridoxine

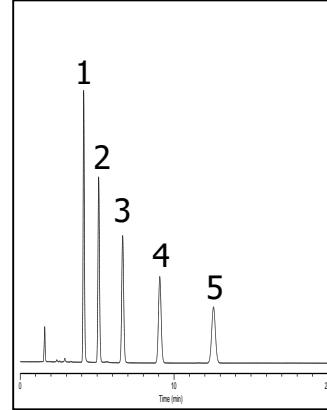

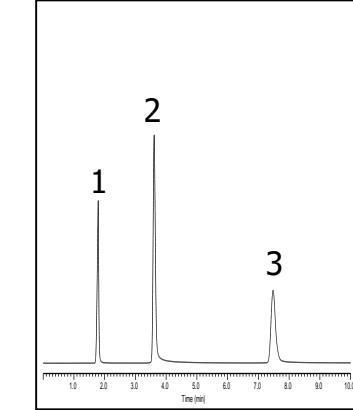

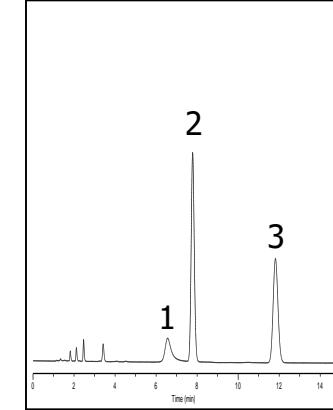

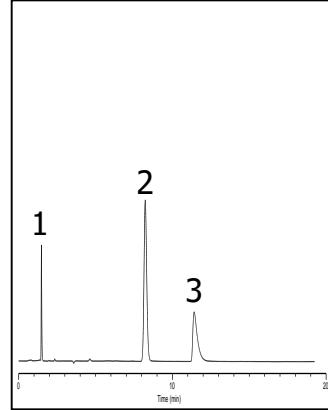

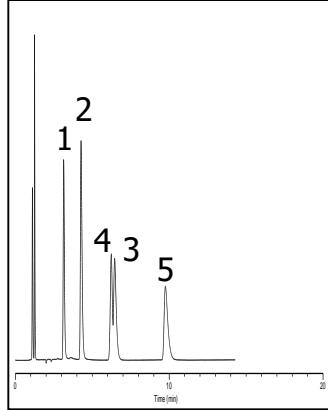

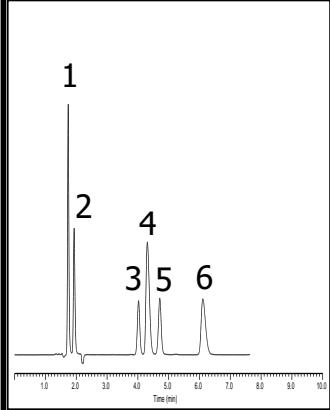

### Conditions

Column	: 5 $\mu$ m, 150 $\times$ 4.6 mm I.D.
Eluent	: 0.1 %HCOOH
Flow Rate	: 1 mL/min
Col. Temp.	: 40 °C
Detection	: UV 210 nm
Injection Vol	: 2 $\mu$ L
Sample	: 1. Pyridoxamine (VB6) 2. Thiamin (VB1) 3. Nicotinic Acid (VB3) 4. Pyridoxal (VB6) 5. Nicotinamide (VB3) 6. Pyridoxine (VB6)
